

TRACKING SYSTEM AND METHOD

ABSTRACT OF THE DISCLOSURE

An internet-based system and method are provided for tracking an engineering or development program from concept to production. The tracking system takes inputs from new engineering or development requests and can also take inputs from separate databases, such as a repair needs database. The new engineering or development request can be submitted by a web link from an existing or created Internet website, or from another source, by a system user. The tracking system can automatically create and update a tracking indicator, accessible by an Internet web link or other means. The tracking system can automatically prompt other internal functions or required inputs when certain key milestones are reached.
